SUMMARY

Backend developer focused on Java / Spring Boot services with real business logic: transactions, real-time data, concurrency, and external API integrations. Over the past year I moved from coursework to system-level projects — a trading platform with a custom matching engine and a modular AI assistant on Spring Modulith — using AI tooling (Claude API, MCP) to speed up supporting components.

SKILLS

Languages: Java (17, 21, 25), SQL, JavaScript/TypeScript (Foundations)

Java Core: Collections (List, Map, Set, Queue), OOP, Generics, Stream API, I/O, Concurrency (synchronized, volatile, ExecutorService, CompletableFuture)

Frameworks: Spring Boot (Core, Data JPA, Security, WebSocket), Spring Modulith, Hibernate, Resilience4j, Bucket4j, MapStruct, Lombok

Databases: PostgreSQL (JOINS, Indexing, Transactions, EXPLAIN ANALYZE), MySQL, Redis (Caching, Queues, Pub/Sub), Flyway Migrations

AI / LLM: Anthropic Claude API (backend integration), Model Context Protocol (MCP), Prompt Engineering

DevOps & Tools: Git, GitHub, Maven, Docker / Docker Compose, Linux / Bash, IntelliJ IDEA, Postman, Swagger / OpenAPI

Testing: JUnit 5, AssertJ, Mockito, Testcontainers (PostgreSQL, Redis)

Methodologies: Agile (Scrum, Kanban), Jira, Code Review (Pull Requests), CI/CD (GitHub Actions)

Principles: OOP, SOLID, DRY, KISS, YAGNI, REST API Design, Clean Architecture, Algorithms & Data Structures

Spoken Languages: English C1 Advanced (EF SET 70/100); Polish — beginner

PROJECTS

Klawia AI Assistant — personal AI assistant for task and project management

Java 25, Spring Boot 4, Spring Modulith, PostgreSQL, Redis, Resilience4j, Bucket4j, Anthropic Claude API, Telegram Bot API, Testcontainers, Docker

github.com/CHIKOJgg/klawia

- Designed a modular monolith (Spring Modulith) split into 12 domain modules (User, Task, Reminder, Agent, Telegram, Analytics) with api/application/domain/infrastructure layers.
- Integrated Anthropic Claude API for a personalized AI chat with system prompt built dynamically from stored user memory and active tasks, plus an async pipeline (@Async) that auto-extracts user facts from conversations.
- Implemented JWT auth with refresh token rotation (reuse of invalidated token revokes all sessions), plus Resilience4j circuit breaker with graceful fallback and Bucket4j request throttling (20 AI calls/hour per user).
- Built event-driven communication between modules via Spring Modulith ApplicationEvents; set up Actuator + Prometheus + custom health indicator for the AI circuit breaker.

- Designed a 10+ table database schema via Flyway migrations; configured Docker Compose (app + PostgreSQL + Redis); built Telegram bot with webhook and deep-linking for account binding.
- Covered core business logic with JUnit 5 + Testcontainers tests against a real PostgreSQL instance.

Trading Platform — banking and exchange trading backend

Java 21, Spring Boot 3.3, PostgreSQL, Redis, WebSocket (STOMP), JWT, Flyway, MapStruct, Apache POI, iText, Docker
github.com/CHIKOJgg/spring-boot-trading

- Built a backend platform with a REST API for bank accounts (open/close, deposits, withdrawals, transfers, statements) and trading accounts; implemented full audit logging of all user actions.
- Implemented a thread-safe in-memory matching engine and order book (price-time priority) for limit and market orders; integrated Redis for order queuing and cache.
- Set up real-time updates over WebSocket (STOMP) for the live order book depth, trade feed, and per-user notifications; designed the database schema (13 tables) with Flyway migrations.
- Added document export via Apache POI (Excel statements) and iText (PDF reports); enforced role-based access (admin vs. user) with Spring Security and JWT.
- Wrote unit and integration tests (JUnit 5, AssertJ), including concurrency tests for the matching engine; containerized the full stack with Docker Compose.

Crypto Portfolio Optimizer — desktop application for crypto portfolio analysis and optimization

Java 21, JavaFX, ojalgo, CoinGecko API, Gson, Maven, Docker
github.com/CHIKOJgg/MarkowitzModel-java-crypto-analysis

- Built data ingestion and caching for up to 365 days of historical price, volume, and market cap data via CoinGecko API; supports CSV import.
- Implemented 12 alpha models (Momentum, EWMA, Mean Reversion, RSI, MACD, Bollinger Bands) and 9 portfolio models (Markowitz, Risk Parity, HRP, CVaR, Black-Litterman, Max Diversification).
- Wrote a walk-forward backtesting engine with risk-adjusted metrics (Sharpe, Sortino, Calmar, VaR/CVaR 95%, max drawdown); added Monte Carlo (GBM) stress testing and Brinson Performance Attribution.
- Separated computation logic from UI (JavaFX + FXML), applied Strategy/Factory/Chain-of-Responsibility patterns; registered 24 ready-to-run strategy combinations.

EDUCATION

Belarusian State University of Informatics and Radioelectronics (BSUIR)

Major: Information Systems and Technologies

September 2024 – 2028, Minsk, Belarus

Certificate: EF SET – 70/100, C1 Advanced (cert.efset.org/ru/cAsbkU)
